

ONASSET

24x7 Visibility Regarding the Whereabouts and Condition of High-Value Assets in the Supply Chain

OnAsset's Vision is a Software-as-a-Service solution that provides shippers with 24x7 visibility regarding the whereabouts and condition of their high-value assets in the supply chain. Vision features intuitive mapping capabilities with custom data overlays that visualize the real-time state and location – as well as the status history – of any high value asset being tracked by OnAsset's SENTRY™ devices.

Shippers and third-party logistics providers use Vision to monitor and analyze the data sent from SENTRY devices in the field, and Vision helps shippers manage response plans in the event of a theft or temperature alert during transit.

Vision's simple, yet comprehensive business rules and management capabilities make it easier for customers to:

- Establish threshold limits regarding the temperature, pressure, humidity, light, motion, shock & vibration of transported assets.
- Create virtual perimeter "geo-fences" that track the location of cargo from origin to destination. Vision can save route groups for frequent transit, or repeat shipments.
- Customize notifications – via email; SMS; or EDI exchange; in the event of an alert.
- Incorporate third-party data feeds that include: weather reports; traffic reports; surveillance cameras at points of interests, such as rest stops or gas stations; airline arrivals; sea port arrivals; crime feeds; and other data feeds.
- Integrate Vision data directly into the ERP systems of shippers, manufacturers, distribution centers and retail outlets – providing complete visibility for in-transit and delivery status.

OnAsset's SENTRY asset tracking devices provide a wealth of data, and the VISION platform enables customers to interpret the data, and turn it into actionable intelligence in the event of an alert during transit.

In addition to helping companies respond to theft, breakage or temperature alerts in minutes, as opposed to hours (or days) – Vision's seamless integration into back-office systems can help companies speed up the cash flow process through **real time invoicing**. The moment a SENTRY device reports that a shipment has entered its "geo-fenced" destination, and SENTRY's light sensor indicates that a box has been opened at the destination (assuming that no other shock or breakage alerts have triggered during transit), Vision can automatically notify the ERP systems of the manufacturer/shipper to send an invoice to the receiver the moment the shipment has been received.

Vision incorporates several other features that are specifically designed to work the way that shippers and logistics providers work. Much more than just 'dots-on-a-map', Vision is a business-centric tool that helps companies **secure the supply chain, reduce transportation costs, and speed up the cash flow process**.
